How to use the Cog Texture Transfer Toolkit

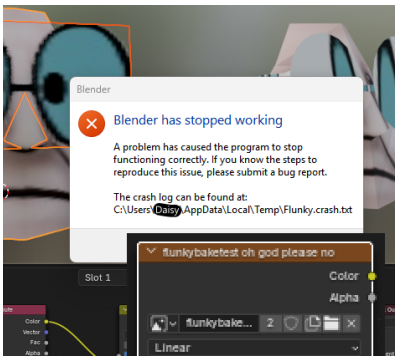

(Last Updated 10/15/2026)

Greetings! This is the guide on how to use the Cog Texture Transfer Toolkit, a collection of .BLEND files used for transferring cog textures between Toontown Rewritten (well, online) and Toontown Corporate Clash UV maps, making texture porting easier! alongside texture creation itself, because... Well, some UV maps from toontown online *Aren't* pretty to look at, thats for sure.

REQUIREMENTS.

- You must have **Blender 4.5.4 LTS or later.** I use Blender 4.5.4 LTS personally, and some earlier versions MIGHT work, but this is untested. Do so at your own risk.
- You must have a program to edit textures manually. Certain textures may have seams from the UV Transfer process, be parts of a palette, or otherwise require manual editing.
  - If you don't, or are looking for a new image editing program for any reason, I'd like to suggest **Krita.** It's free, open source, and really good from my experience.
- Basic knowledge on Toontown Rewritten and Corporate Clash's texture placement and file names is required for content pack creation. Just know where cog heads are and you'll be fine.

Other things to note, before getting started.

- Flunky glasses no longer crash blender!!! as it turns out I was going about things in a really really foolish way
  - I'm still keeping the image of blender crashing here though as its funny. See the end of the document for added info.
- Flunky Glasses are in their own .blend file
- Clash Mr. Hollywood has glasses that cannot be transferred over when transferring textures. Clash Mr. Hollywood WILL require manual editing. Creators transferring textures to rewritten can disregard this.
- Backstabbers and Big Wigs use custom UV Maps as their Clash counterparts use an entirely separate model.
- Ambulance Chaser has been excluded from this pack. They already have a rerigged head UV in Rewritten, and Clash uses a separate model.
- Mr Hollywood and Yesman share textures in rewritten.

    - Surprisingly, despite being identical, Glad Handers use a different texture that is part of a palette.
- **The following groups of cogs are all palettized in Toontown Rewritten. Manual editing is required:**
    - Short Change/Cold Caller, Micromanager, Money Bags, and Glad Hander are a part of phase_3.5's *tutorial_suits_rerigged_palette_3cmla_1.jpg*
    - Ambulance Chaser, Backstabber, Bean Counter/Downsizer's Head, and The Big Cheese are a part of phase_4's *suit-heads_rerigged_palette_3cmla_1.jpg*
    - Big Wigs, Head Hunters, Legal Eagles, and Loan Sharks are a part of *suit-heads_rerigged_palette_3cmla_2.jpg*
    - Penny Pincher and Downsizer/Bean Counter's Hat are a part of phase_4's *suit-heads_rerigged_palette_3cmla_3.jpg*
        - I don't know why it's like this.
- **The following cogs share models. Use the respective blend files for texture transfers:**
    - Spin doctors share models with telemarketers, use *telemarketer.blend*
    - Bloodsuckers share models with Mover & Shakers, use *movershaker.blend*
    - Bottom Feeders share models with Tightwads, use *Tightwad.blend*
    - Robber Barons share models with Yesmen, use *Yesman.blend*
    - Number Crunchers share models with Name Droppers, use *Name Dropper.blend*
    - Double Talkers, Two-Faces, and Minglers share models, use *Mingler.blend*
    - Cold Callers and Short Changes share models, as well as textures in Rewritten. Use *shortchange.blend*
        - Using short change's texture is recommended when converting to Rewritten as Cold Callers are tinted in engine.
- **All textures export as png, manual format conversion to jpg will be required with rewritten cogs.** I apologize for the inconvenience

- If anything confuses you, or you happen to experience any form of difficulty with this process, please **don't be afraid to reach out!!!**
    - My discord is **@daisygardensinc**, just make sure to send a message stating you're having technical difficulties with the Cog Texture Transfer Toolkit, otherwise I won't know what you're Dming for!
        - You can also ping me in the Toontown Content Packs discord server if you don't feel comfortable with Dming. I'd suggest pinging in #technical-nerds as that is where I posted most of my progress during the creation of this project.

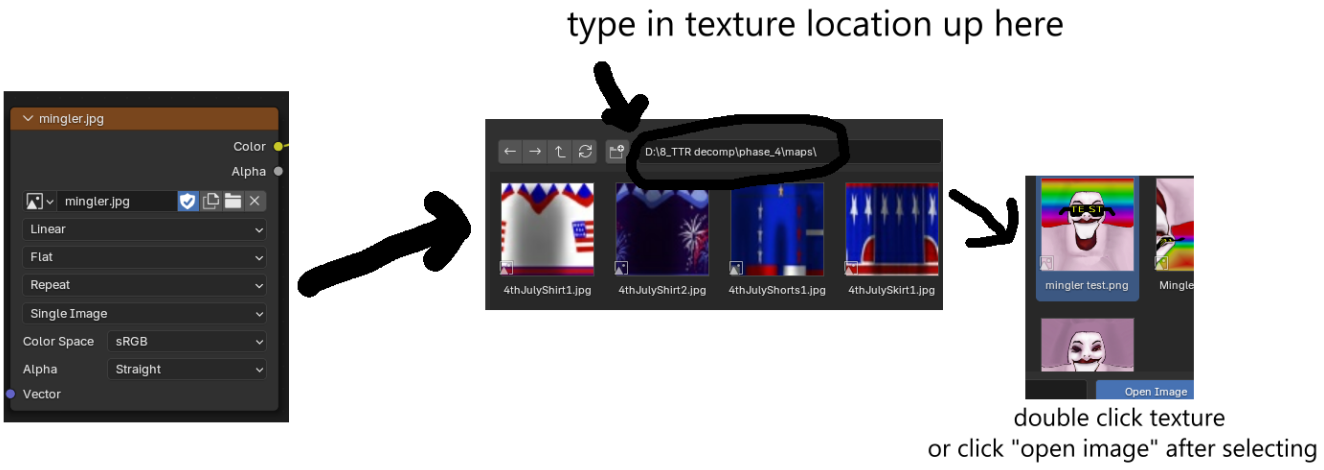

With all of that out of the way..

LET'S TRANSFER SOME TEXTURES, SHALL WE?

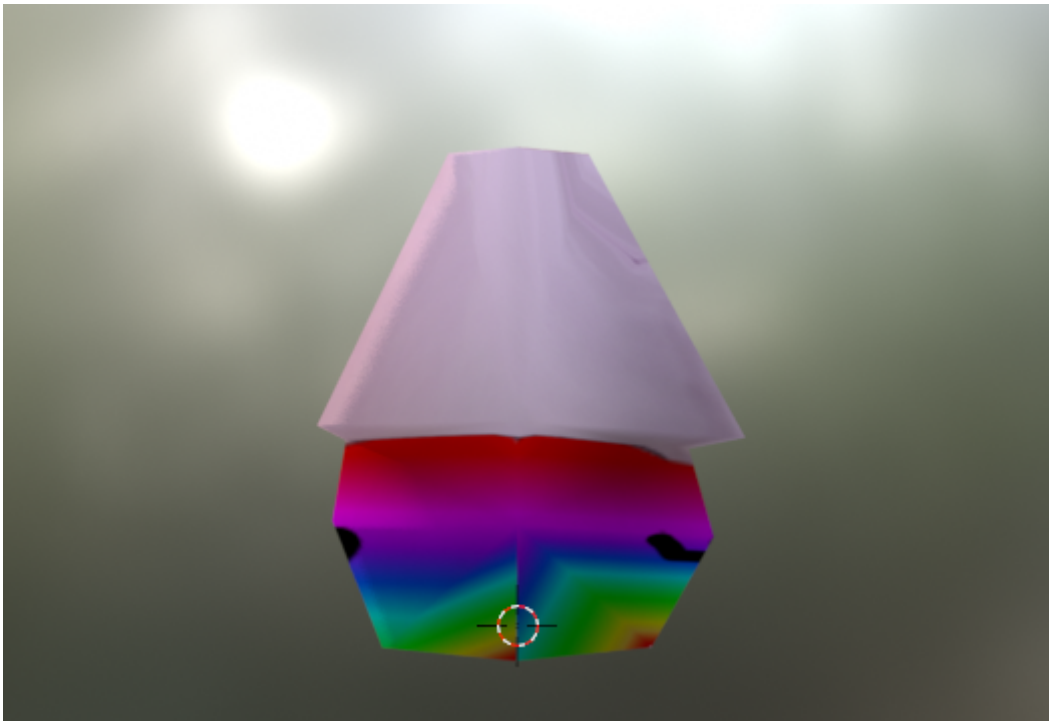

I'll be using the Mingler for this demonstration. This process will show how to transfer a Clash UV to rewritten, but it will work about the same the other way around. To start things out, when you open each .blend file, it will look like this.

First, let's focus on the image node, denoted in Orange on the layer thingy
Click the folder icon, this will bring you to a file browser. At the top of the area, it'll show where the current directory is. Either type in the directory your texture is stored, or just navigate there yourself.

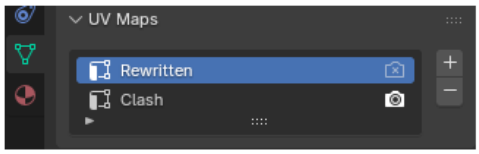

Congratulations! Now you have the- OH MY GOODNESS
If the texture looks normal, please disregard this next step.

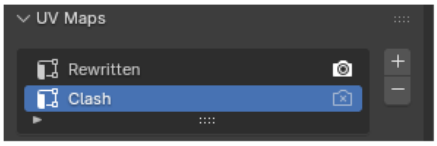

Worry not, this is simply displaying on the wrong UV! On the righthand side of the screen, there's a small area noted by a green triangle. This has the UV maps on it. Use the camera button next to each UV map to select which UV map you want to preview. And, while we're here, select which UV you want to transfer TO. Below is a diagram of how it should look for each.

Clash -> Rewritten

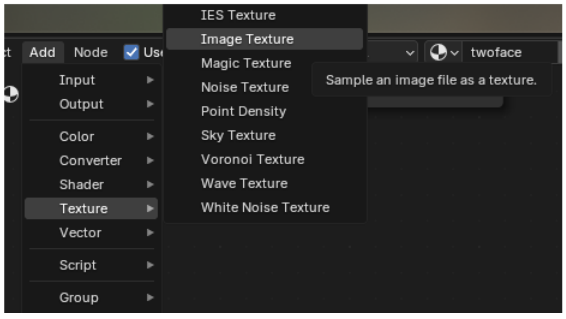

Rewritten -> Clash

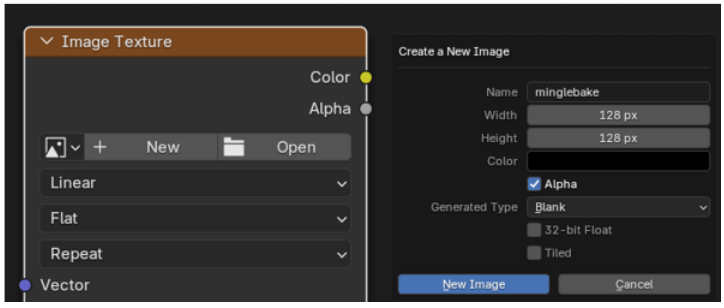

Now look at that! All stunning!!!! next, we have to create an image texture for it to be baked to. The process is simple, as shown off in this graph. I can't explain very well so hopefully the visual will suffice.

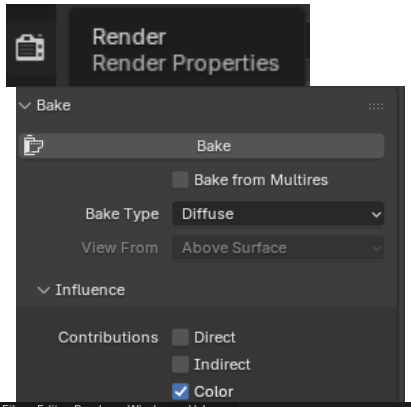

add image texture
(you can also use Shift+A and search for "Image texture)

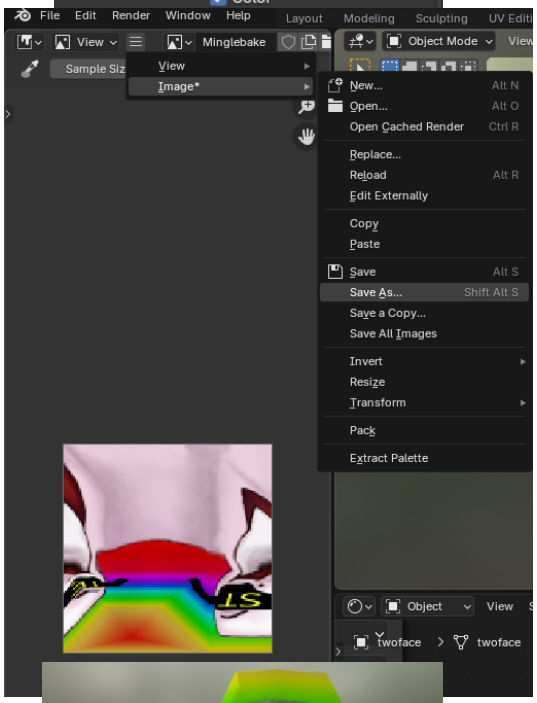

click "new", name texture and choose resolution
(common resolutions: 64x64, 128x128, 256x256, 512x512.
palettized cog heads might want more resolution since its
four cog heads in one texture)
hit "New Image" at the bottom once you've got all that dealt with.

Well, now we're pretty much ready to go. There is this Render Properties button on the same toolbar the uv map stuff was. Click it and scroll all the way down to Bake. Make sure the bake type is set to "Diffuse", and the only selected contribution is "color". Select the model, select the texture you're baking to, Click bake, and you're good to go!

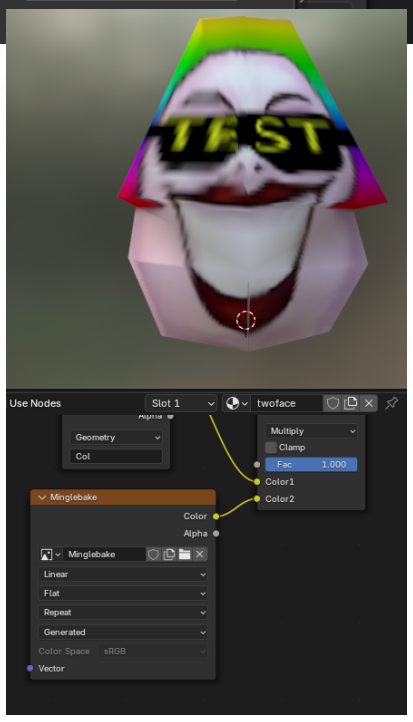

On the lefthand side, you'll see your newly baked texture. Click the three lines at top, go into image → save as, and then save your texture somewhere.
You can also use this .blend file to see the texture on the model! Just change the image to the newly baked image and click the camera the uv map is formatted for.

For cogs with multiple textures (COUGH COUGH BEAN COUNTER FOR SOME REASON.), youll need to add the image to both materials (in the tab with the red checkered ball.) when converting to clash. Otherwise, you'll just need to redo the process twice.

Sometimes textures will not be perfect squares (like penny pincher and bean counter's hat, or Flunky Glasses). in this case, just use the resolution those ones use, or a multiple of that resolution. (128x64.)

Addendum: some troubleshooting!!
cog shows up as entirely red? Change the IOR on "Principled BSDF" to 1.
hopefully everything else works out though.

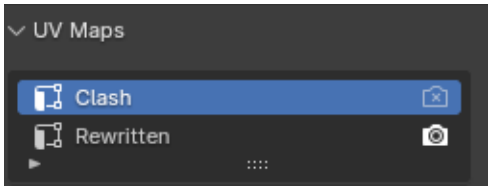

With that all said, HAVE A TOONTASTIC DAY, AND I HOPE YOU ENJOY!!!

and, once again, feel free to reach out if you have any trouble.

THE FLUNKY GLASSES ADDENDUM

Greetings! This is an addendum to the Cog Texture Transfer Toolkit, regarding flunky glasses.

The process is roughly the same, except for a few things.

- UV maps start with clash first and rewritten second. Sorry if this confuses muscle memory.
- Some distortion may be present when transferring between UV maps. I apologize for this.
- MARGINS. Margins are important. Under bake, make sure margins are set to 0px ESPECIALLY when transferring to rewritten. Otherwise, baked textures will come out with unwanted pixels making the glasses thicker than intended.

I don't have much of anything else to add. Have a good day!!
